

1. Create a virtual machine with two operative systems: Windows 7 and Windows 10. Choose Windows 7 as the default operating system. Windows 7 must boot after 5 seconds unless Windows 10 is manually selected.

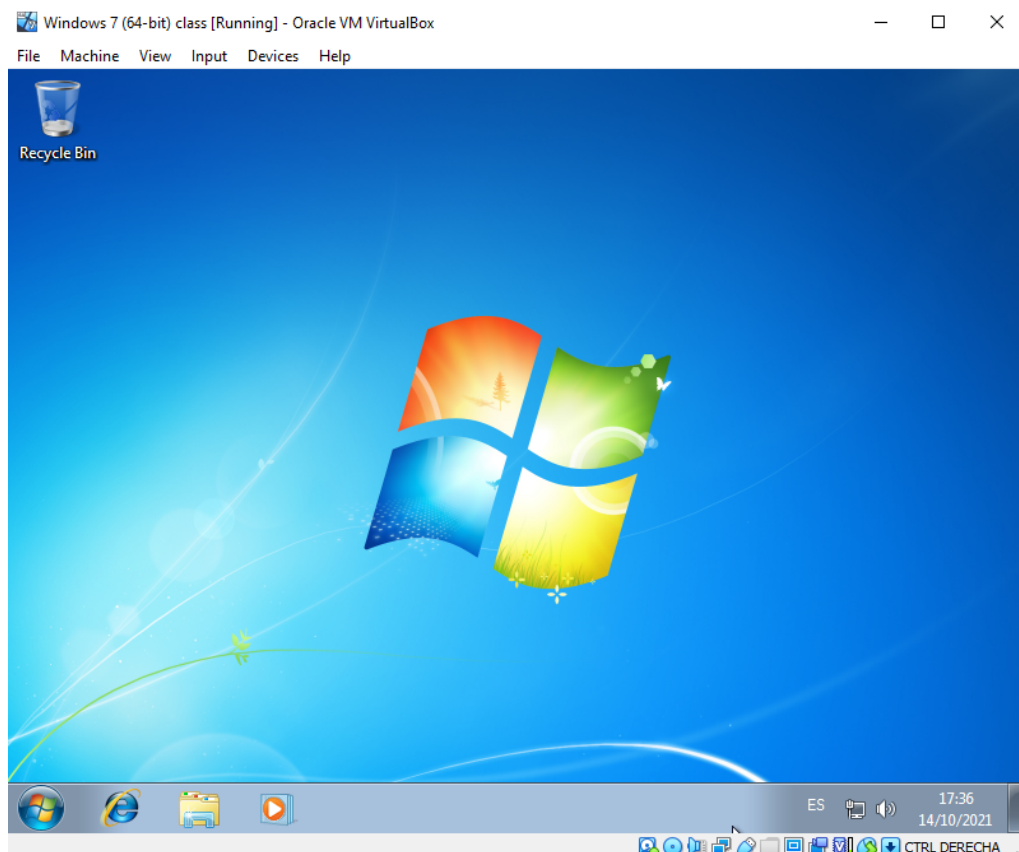

After installing Windows 7 and Windows 10, we shutdown the computer. Turning the machine on will lead us to this page in which we will choose the O.S.

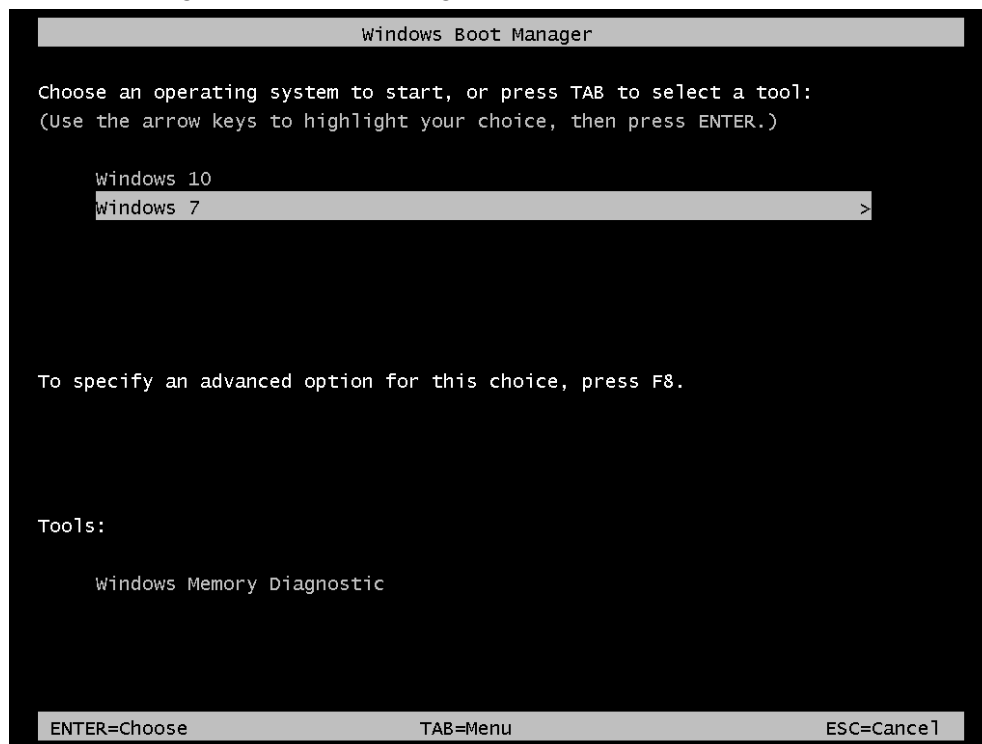

In order to get windows 7 to run as default we need to change the default operating system as windows 10 is set to default when we install the dual boot.

We can see that windows 7 will boot automatically after a set of seconds.

In this image it is shown the boot manager of Windows 7. In order for us to change the timeout setting, we will be initiating the virtual machine in Windows 10.

Once Windows 10 is initiated, we will go to System properties > Startup and Recovery and we will be able to change the timeout setting to 5 seconds.
