

First we start the virtual machine using drbl. This is because it has gparted already installed.

Now we will create the partitions mentioned on the gparted exercise page.
Then I will show how the partitions are shown in the windows 10 operating system.

Keep in mind I am using a windows 10 virtual machine.

Answer the following questions:

1. The file does not show the management system because it is EXT4 and in windows does not have a label or it does not read linux's partitions.
2. I would use the 2GB unallocated which remain in the 10GB disk.
